

The hamster, refined.

We've performed thousands of inside jobs. Neonatal thymectomies. Others listed here. And more. Most designed to try to help solve today's medical problems.

Adrenalectomies are just one operation that allows testing of products that might replace the activity or function of the organ removed.

For your basic unilateral nephrectomy or any order to go, just call. Your customized hamsters will be there when you need them.

Lakeview is one of few hamster breeders whose hypophysectomies (and all other operations) are done on defined flora animals.

Splenectomized hamsters (and all others) reach you in filtered shippers. And the out come will be just what you want.

So whether it's castrations or any of the procedures mentioned, the end of our perfect operation is the beginning of yours.

Lakeview Hamster Colony

Do You Know *IgG, IgA, IgM,*

*α_1 —Antitrypsin, Haptoglobin, C3,
 β —Lipoprotein, Transferrin, Albumin,
 α_1 —Acid Glycoprotein, α_2 —Macroglobulin...?*

If your laboratory is one of those sophisticated enough to take advantage of specific serum protein quantitation for supportive evidence of pulmonary disease, collagen disorders, autoimmune diseases, infections, hepatic and renal diseases, anemias, lipoproteinemias, immunologic deficiencies, and other clinical problems, you *do* know. You are one of those who can appreciate the benefits of an elegant and reliable technique for specific protein assays, and the advantages of having accurate results available for use in less than 30 minutes. If you know, then your laboratory is ready for an economical Automated Immunoprecipitin System for quantitation of specific serum proteins. Let us tell you about it.

Test tubes to answers.

The complete radioassay systems.

Searle Analytic (formerly Nuclear-Chicago) offers you the only complete on-line radioimmunoassay/competitive protein binding (RIA/CPB) systems.

Systems that automate the entire radioassay procedure—from analyzing RIA/CPB samples to printing out immediate, meaningful results. You only load standards and samples, establish assay protocol, start the system, and retrieve final, hard copy answers. Our systems do all the rest!

Assay preparation isn't changed at all. Yet answers are transformed directly to averaged count rate, normalized percent bound, standard deviation, dose, corrected dose, and confidence range for each sample group. It's all performed by our RIA/CPB Data Processor, which can be linked to either our beta or

gamma spectrometer systems. The combination provides unprecedented speed and convenience in data-reduction.

But we didn't stop with immediate answers in RIA. For the wide variety of kits now in commercial use, our spectrometer systems let you program and count many combinations of tests in the same run. Or, with our exclusive **SRA 2TM System**, simultaneously operate both beta and gamma systems from a single RIA/CPB Data Processor.

Whatever the demand—raw RIA/CPB data, spectrometer systems for any use, or the right systems for your particular lab—we provide complete answers. You'll find your questions answered in our free brochure, *RIA/CPB Data Systems*. Write to us today.

**The first commercially available
isolator-derived
HAMSTER**

**is proudly announced by the leader in white rats
and other gnotobiotic laboratory animals.**

Through a process of treatment, caesarean section, foster suckling and isolator rearing a clean hamster has been produced. The unique characteristics of the golden hamster make this animal exceptionally well suited and valuable for certain types of biomedical research. Among such uses are: tumor growth in the cheek pouch, both homografts

and heterografts; tissue transplantation, dental caries, studies in virology and bacteriology, aging, hibernation, cardiovascular research, pharmacology and nutritional studies.

Call or write for more details on availability and prices of this important addition to the ARS/Sprague-Dawley line of top quality laboratory animals.

**Now, preparing
protein-assay plates is
as easy as
turning the tap...**

Introducing effort-saving...time-saving MCI FILMS

Remarkable, new, rehydratable agarose films
for IEP, CEP, AGD, lipoprotein and
other protein electrophoresis procedures.

**A new standard of
convenience, reproducibility
and readability never before
available for serum protein
analysis**

Convenient storage and preparation

MCI's rehydratable agarose
films can be stored compactly in
the refrigerator at 4°—8° C.
for up to 1 year. They take much
less space and care than any of
the currently available wet gel
systems.

Reproducible, reliable, readable results

MCI Films can be used in a
variety of procedures, i.e.,
immunoelectrophoresis (IEP),
counterelectrophoresis (CEP),
various agar gel diffusion tests
(AGD), and serum protein
electrophoresis procedures such
as lipoprotein, lactic dehydro-
genase isozymes and alkaline
phosphatase isozymes. Because
of the unusual clarity of the
agarose gel and the sharpness
of the endpoints, many results
may be read without staining.

Eliminates tedious procedures

No more pouring of plates.

No more wells or troughs to be
meticulously cut and painstakingly
removed. No more im-
purities, air bubbles or foreign
bodies. Just rehydrate the film
according to instructions and
you'll have a film of remarkable
clarity and uniform thickness,
with wells and troughs perfectly
cut and evenly spaced.

And eliminates many problems

No more wasted plates, time,
and energy. Distorted patterns
due to slippage are eliminated
because this film will not shift,
slip off or separate from its
plastic backing throughout the
entire procedure. Since the film
stays dry until you need it, there
is no need for bacteriostatic
agents which can alter protein
migration and patterns. The

agarose concentration will not
interfere with the migration of
large molecules. And, wet or
dry, the film remains flexible so
that wells and troughs will not
crack and cause distorted
precipitin patterns.

A permanent record

The films can be dried, cut
and then attached to the
patient's record or used for
direct projection.

INFLAMMATION:

Mechanisms and Control

by IRWIN H. LEPOW and PETER A. WARD

This book is an up-to-date survey of research on the nature of the inflammatory response and the possibilities of modulating various inflammatory disorders. Emphasis is placed on discussion of the basic morphologic and biochemical aspects of the inflammatory response; the immunopathology of inflammation; and experimental and clinical modulation of the inflammatory response.

1972, 424 pp., \$14.00

THE ANTIGENS, Volume 1

edited by MICHAEL SELA

This is the first volume of a major work that will constitute a comprehensive treatise of modern immunochemistry. It deals specifically with antigens and the molecular aspects of immunology, discusses nucleic acids and enzymes as antigens, and devotes authoritative chapters to immunoglobulins.

Tentative Contents: B. D. STOLLAR: Nucleic Acid Antigens. R. ARNON: Immunochemistry of Enzymes. J. A. GALLY: Structure of Immunoglobulins. R. MAGE, R. LIEBERMAN, M. POTTER, and W. D. TERRY: Immunoglobulin Allotypes. N. ARNHEIM: The Evolution of Proteins. R. T. KUBO, B. ZIMMERMAN, and H. M. GREY: Phylogeny of Immunoglobulins. K. ISHIZAKA: Chemistry and Biology of Immunoglobulin E.

November 1973, about 500 pp., in preparation

TRANSPLANTATION ANTIGENS

Markers of Biological Individuality

edited by BARRY D. KAHAN and RALPH A. REISFELD

IMMUNOLOGY: An International Series of Monographs and Treatises

This volume synthesizes the available information on the ontology, phylogeny, cell and tissue distribution, cross-reactivities, and biological characterization of transplantation antigens.

1972, 566 pp., \$29.50

GENETIC CONTROL OF IMMUNE RESPONSIVENESS

Relationship to Disease Susceptibility

edited by HUGH O. McDEVITT and MAURICE LANDY

A Volume of PERSPECTIVES IN IMMUNOLOGY

A Series of Publications Based on Symposia Sponsored by NIAID

This final Brook Lodge Immunology Conference—organized by the National Institute of Allergy and Infectious Diseases—brings together a large amount of new, unpublished data on several exciting recent developments. It explores the implications of these discoveries for antigenic recognition and the generation of diversity and the prospect of finally perceiving a rational basis for individual susceptibility to an extensive spectrum of disease states, notably viral oncogenesis and autoimmune disorders. 1973, 488

pp., \$19.50

PROCEEDINGS OF THE SEVENTH LEUCOCYTE CULTURE CONFERENCE

edited by FRITZ DAGUILLARD

This seventh volume in the Leucocyte Culture Conference series covers a wider range of topics than any of its predecessors. Contributions deal not only with the technical aspects of lymphoid cell culture, but also with the early events of lymphocyte transformation and biochemical aspects of the proliferative response of lymphocytes to mitogens. The book also emphasizes the heterogeneity of immunocompetent cells reacting *in vitro*, as well as the immunological significance of the lymphocyte response to mitogens.

1973, 716 pp., \$21.50

TISSUE TYPING AND ORGAN TRANSPLANTATION

edited by EDMOND J. YUNIS, RICHARD A. GATTI, and D. BERNARD AMOS

Here is a comprehensive, up-to-date introduction to transplantation biology—a field that has made extremely rapid progress in recent years. Part 1 discusses theoretical and technical aspects of assessing genetic disparity between donor and recipient, and the chemistry of transplantation antigens. Part 2 concerns surgical and clinical problems of kidney and bone marrow transplantation. The final chapter provides a critical appraisal of the whole field of transplantation.

1973, 490 pp., \$16.50

VIRUS TUMORIGENESIS AND IMMUNOGENESIS

edited by WALTER S. CEGLOWSKI and HERMAN FRIEDMAN

This volume discusses six areas of contemporary significance: general perspectives in tumor viruses and immunity; the effect of altered host response on tumor virus susceptibility; the effect of tumor viruses on humoral immunity; the effect of tumor viruses on cellular immunity; the influence of chemotherapy and immunotherapy on tumorigenesis; and the relevance of tumor virus models to the study of tumorigenesis and immunogenesis.

1973, 424 pp., \$13.00

ADVANCES IN IMMUNOLOGY, Volume 16

edited by F. J. DIXON, Jr. and HENRY G. KUNKEL

Volume 16 covers such topics as: Human Immunoglobulins; Immunological Unresponsiveness; the Participation of Lymphocytes in Viral Infections; and Immune Complex Disease in Experimental Animals and Man.

1973, 384 pp., \$21.00

because
of
chance

Chance is often the way scientific discoveries are made. Lab-Tek has developed a micro-tissue culture system for research and clinical studies that conserves costly materials, time, and space...and that's not by chance. Durable plastic chambers attached to a glass slide by a removable gasket simplify work. No tubes. No dishes. No need to transfer cells. Avoids dangers of contamination. The start-to-storage system assures you of a readable permanent record because it's on the slide. Lab-Tek's *good manufacturing procedures* insure reproducible results. Lab-Tek® Tissue Culture CHAMBER/SLIDE is useful for growing clones, cell lines, and strains. We have many reports of how useful Tissue Culture CHAMBER/SLIDES are for ANA and other FA techniques but if by chance you've adapted our CHAMBER/SLIDE to some other useful technique, please let us know.

Lab-Tek Tissue Culture CHAMBER/SLIDES, #4808 (8-chamber), are available from your Lab-Tek Products Service-Certified Distributor.

Immuno-Tec™ GAMMOPATHY KIT

simplifies immuno-electrophoresis

This complete little package contains almost everything you need except the specimen and some equipment. The gammopathy kit contains 10 rehydratable films, 4 different antisera, buffer, tracking dye, supports, blotting and wick paper.

The MCI-IEP rehydratable film* (highly purified agarose bonded to a plastic sheet) eliminates the cumbersome task of pouring and punching IEP slides, and can also be used as a permanent record, thus reducing the costs of photographs.

The Behring antisera assist you in detecting IgG, IgA and IgM monoclonal gammopathies. Bence Jones proteins can be detected by their reaction with Anti-IgG serum specific for H and L chains.

Behring antisera and the rehydratable film can be purchased separately.

BD831

IF YOU TALK ABOUT IMMUNOCHEMICALS— WE WILL UNDERSTAND YOU!

各种免疫试验用品应有尽有

אם אתה מדבר על אימונוכימיקלים - אכחנו נבין אותך!

We speak English, French, Chinese, Hebrew and Swahili, but mostly we speak Immunochemicals, and that is the language we speak best.

Does it seem strange that our goats graze the hills leading to Jerusalem and yet if we don't leave the rabbit houses before 4:30 p.m., we get caught in the five o'clock rush back to the lab in Kankakee? Strange, perhaps, but our animals are certainly productive! Jointly, Miles-Yeda, Rehovot, Israel, and Miles Research Division, Kankakee, Illinois, produce over 150 different antisera, immunodiffusion plates, immunochemical kits and immunoadsorbents.

We find our international environment stimulating, too. Our involvement with the Weizmann Institute of Science (we are right on the campus) plus the technological advances made at our Kankakee labs provide insight and background to produce the products you need.

We invite your questions, comments or suggestions. Again, we don't care what the accent is—if you speak *Immunochemicals*, we will understand you.

Reach us by phone in the U.S.A. at 815 939-4417, or in Israel at 03 95-29-22, or by letter through any of our offices listed.

Ask for P. K. or Tsvi.
