On the cover: The structure of the V $\gamma$ 2V $\delta$ 2 T cell Ag receptor is shown with the CDRs colored. Alanine mutations in all CDR loops altered recognition of prenyl pyrophosphates with strong contributions from germline elements of CDR3 $\delta$  (green residues) but minimal contributions from CDR3 $\delta$  (yellow residues). These results show that prenyl pyrophosphate recognition primarily involves germline-encoded regions of the  $\gamma\delta$  TCR, allowing a high proportion of V $\gamma$ 2V $\delta$ 2 TCRs to respond. The large footprint strongly supports the existence of a presenting molecule for these Ags. Wang, H., Z. Fang, and C. T. Morita. 2010. V $\gamma$ 2V $\delta$ 2 T cell receptor recognition of prenyl pyrophosphates is dependent on all CDRs. *J. Immunol.* 181: 6209–6222.
